# Pol Sci 630: Problem Set 2 Solutions - Properties of Random Variables

Prepared by: Anh Le (anh.le@duke.edu)

Due Date for Grading: Friday, September 11, 2015, 10 AM (Beginning of Class)

# 1. Expected Value and Its Properties

a.

(1/4 point) (DeGroot, p. 216) Suppose that one word is to be selected at random from the sentence 'the girl put on her beautiful red hat'. If X denotes the number of letters in the word that is selected, what is the value of E(X)?

#### Solution

As the number of letters in a word, X can take on following values:  $x \in$  $\{2, 3, 4, 9\}$ , with probability as follows:

$$P(X=2) = \frac{1}{8}$$
 (1 word ("on") out of 8 words in the sentence) (1)

$$P(X = 2) = \frac{1}{8}$$
 (1 word ("on") out of 8 words in the sentence) (1)  
 $P(X = 3) = \frac{5}{8}$  (2)  
 $P(X = 4) = \frac{1}{8}$  (3)

$$P(X=4) = \frac{1}{8} \tag{3}$$

$$P(X=9) = \frac{1}{8} \tag{4}$$

Therefore,

$$E(X) = \sum_{allx_i} x_i P(X = x_i) = 3.75$$

b.

(2/4 point) (Degroot p. 216) Suppose that one letter is to be selected at random from the 30 letters in the sentence given in Exercise 4. If Y denotes the number of letters in the word in which the selected letter appears, what is the value of E(Y)?

Solution

Y can take on values  $y \in \{2, 3, 4, 9\}$  with probability as follows:

$$P(Y=2) = \frac{2}{30}$$
 O,N (5)

$$P(Y = 3) = \frac{15}{30}$$
 T,H,E, P,U,T, H,E,R, R,E,D, H,A,T (6)

$$P(Y=4) = \frac{4}{30}$$
 G,I,R,L (7)

$$P(Y = 9) = \frac{9}{30}$$
 B,E,A,U,T,I,F,U,L (8)

Therefore,

$$E(Y) = \sum_{\text{all } y_i} y_i P(Y = y_i) = \frac{73}{15} = 4.867$$

c.

(1/4 point) (Degroot, p. 224) Suppose that three random variables  $X_1$ ,  $X_2$ ,  $X_3$  are uniformly distributed on the interval [0, 1]. They are also independent. Determine the value of  $E[(X_1 - 2X_2 + X_3)^2]$ .

#### Solution

$$E[(X_1 - 2X_2 + X_3)^2] = (9)$$

$$= E(X_1^2) + 4E(X_2^2) + E(X_3^2) - 4E(X_1X_2) + 2E(X_1X_3) - 4E(X_2X_3)$$
 (10)

$$= E(X_1^2) + 4E(X_2^2) + E(X_3^2) - 4E(X_1)E(X_2) + 2E(X_1)E(X_3) - 4E(X_2)E(X_3)$$
(11)

Since each  $X_i$  is uniformly distributed on [0, 1],

$$E(X_i) = \frac{1}{2} \tag{12}$$

$$E(X_i^2) = \int_0^1 x^2 dx = \frac{1}{3}$$
 law of unconscious statistician (13)

Note: Law of unconscious statistician  $E[g(x)] = \int g(x)f(x)dx$ . This is an important theorem because it allows us to work with any function of a variable, as long as we know the distribution of that variable.

Alternatively, a common trick to find  $E(X^2)$  is:

$$E(X^{2}) = Var(X) + [E(X)]^{2}$$
(14)

$$= \frac{1}{12} - \frac{1}{4} = \frac{1}{3} \qquad \text{look up variance of uniform variable} \tag{15}$$

Plug everything back in, we have  $E[(X_1 - 2X_2 + X_3)^2] = \frac{1}{2}$ 

# 2. Variance and its properties

For this problem, you can use the properties of expected value.

a.

(1/4 point) Prove that  $Var(aX + b) = a^2 Var(X)$ . Solution

$$Var(aX + b) = E[(aX + b)^{2}] - (E[(aX + b)])^{2}$$

$$= E[a^{2}X^{2} + 2abX + b^{2}] - a^{2}[E(X)]^{2} - 2abE(X) - b^{2}$$

$$= a^{2}(E(X^{2}) - [E(X)]^{2})$$
(18)

$$= a^2 Var(X) \quad \Box \tag{19}$$

b.

(2/4 point) Implement in R two functions that calculates the variance of the sum of two variables in two ways. The first calculates Var(X + Y). The second calculates Var(X) + Var(Y) + 2Cov(X, Y).

You should use vectorized operation and check that two functions return the same result. You may not use R's built-in var() and cov() functions.

#### Solution

```
sumVar1 <- function(X, Y) {
   Z <- X + Y
   return(sum((Z - mean(Z))**2) / (length(Z) - 1))
}

sumVar2 <- function(X, Y) {
   varX <- sum((X - mean(X))**2) / (length(X) - 1)
   varY <- sum((Y - mean(Y))**2) / (length(Y) - 1)
   covXY <- sum((X - mean(X)) * (Y - mean(Y))) / (length(X) - 1)
   return(varX + varY + 2 * covXY)
}

set.seed(1)
X <- rnorm(100) ; Y <- rnorm(100)
sumVar1(X, Y)

## [1] 1.722583

sumVar2(X, Y)</pre>
```

c.

(1/4 point) (Degroot, p. 232) Suppose that one word is selected at random from the sentence 'the girl put on her beautiful red hat'. If X denotes the number of letters in the word that is selected, what is the value of Var(X)?

#### Solution

Notice that the distribution of X is the same as in Question 1a), therefore E(X) = 3.75 and

$$E(X^2) = \sum_{i=1, x_i} x_i^2 P(X = x_i) = \frac{73}{4}$$

Thus,

$$Var(X) = E(X^{2}) - [E(X)]^{2} = \frac{67}{16}$$
(20)

## 3. Binomial distribution

(Credit to Jan) This problem is taken from Pitman (1993) Probability

Suppose a fair coin is tossed n times. Find a simple formula in terms of n and k for the following probability:  $Pr(k \ heads | k-1 \ heads \ or \ k \ heads)$ . Please pay close attention to the formula, particularly what event is conditioned on what events. (Ch. 2.1, Problem 10 b) (p. 91)

Hint 1: Use the binomial distribution to model this.  
Hint 2: Use 
$$Pr(A|B) = \frac{Pr(A \cap B)}{Pr(B)}$$
 with  $A = k$  heads and  $B = k$ 

1 heads or k heads)

#### Solution (Credit to Jan)

$$= \frac{Pr(k \text{ heads}|k-1 \text{ heads or } k \text{ heads})}{Pr(k \text{ heads}) + Pr(k-1 \text{ heads or } k \text{ heads})}$$

$$= \frac{Pr(k \text{ heads}) + Pr(k-1 \text{ heads})}{Pr(k \text{ heads}) + Pr(k-1 \text{ heads})}$$

$$= \frac{\binom{n}{k} 0.5^k 0.5^{n-k}}{\binom{n}{k} 0.5^k 0.5^{n-k} + \binom{n}{k-1} 0.5^{k-1} 0.5^{n-(k-1)}}$$

$$= \frac{\binom{n}{k} 0.5^n}{\binom{n}{k} 0.5^n + \binom{n}{k-1} 0.5^n}$$

$$= \frac{\binom{n}{k}}{\binom{n}{k} + \binom{n}{k-1}}$$

$$= \frac{n!}{(n-k)!k!}$$

$$= \frac{n!}{(n-k)!k!} + \frac{n!}{(n-(k-1))!(k-1)!}$$

$$=\frac{\frac{n!}{(n-k)!k!}*\frac{n-k+1}{n-k+1}}{\frac{n!}{(n-k)!k!}*\frac{n-k+1}{n-k+1}+\frac{n!}{(n-k+1)!(k-1)!}*\frac{k}{k}}{\frac{n!(n-k+1)}{(n-k+1)!k!}}$$

$$=\frac{\frac{n!(n-k+1)}{(n-k+1)!k!}}{\frac{n!(n-k+1)}{(n-k+1)!k!}+\frac{n!}{(n-k+1)!k!}}$$

$$=\frac{n!(n-k+1)}{n!(n-k+1)+n!k}$$

$$=\frac{n-k+1}{n-k+1+k}$$

$$=\frac{n-k+1}{n+1}$$

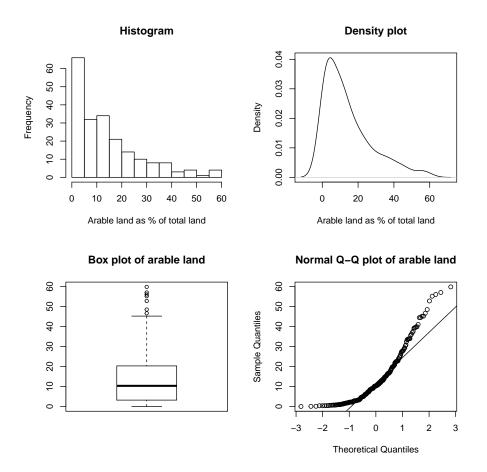

# 4. Plotting distribution

For this problem, you'll need to Google some R techniques (e.g. side-by-side / overlapping plot). Also, label the axes and the plots accordingly.

#### a.

(1/4 point) Download a variable you are interested in, using WDI. Plot the histogram, density plot, boxplot, and normal quantile plot.

```
# install.packages("WDI")
library(WDI)
## Loading required package: RJSONIO
d_land <- WDI(indicator = c("AG.LND.ARBL.ZS", "NY.GDP.PCAP.KD"),</pre>
              start=2010, end=2010, extra=TRUE)
d_land <- d_land[d_land$region != "Aggregates", ]</pre>
# Rename column
colnames(d_land) [colnames(d_land) == "AG.LND.ARBL.ZS"] <- "arable_land_pct"</pre>
colnames(d_land) [colnames(d_land) == "NY.GDP.PCAP.KD"] <- "gdp_percapita"</pre>
xlabel <- "Arable land as % of total land"</pre>
par(mfrow=c(2, 2))
hist(d_land$arable_land_pct, main = "Histogram", xlab = xlabel)
plot(density(d_land$arable_land_pct, na.rm = TRUE), main = "Density plot", xlab = xlabel)
boxplot(d_land$arable_land_pct, main = "Box plot of arable land")
qqnorm(d_land$arable_land_pct, main = "Normal Q-Q plot of arable land")
qqline(d_land$arable_land_pct)
```

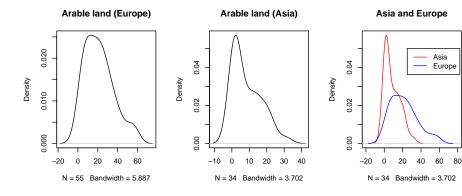

### b.

(1/4 point) Plot the density plots of that variable for Europe and Asia, 1) side by side (Hint: par(mfrow=c(?, ?))), and 2) overlapping in the same plot.

```
par(mfrow=c(1, 3))
europe_density <- density(
    d_land[d_land$region == "Europe & Central Asia (all income levels)", "arable_land_pct"],
    na.rm=TRUE)
asia_density <- density(
    d_land[d_land$region == "East Asia & Pacific (all income levels)", "arable_land_pct"],
    na.rm=TRUE)
plot(europe_density, main = "Arable land (Europe)")
plot(asia_density, main = "Arable land (Asia)")

# Overlaying</pre>
```

```
plot(asia_density, xlim = c(-20, 80), col='red', main = "Asia and Europe")
lines(europe_density, col='blue')
legend(25, .05, c("Asia", "Europe"),
    lty=c(1,1), # gives the legend appropriate symbols (lines)
    lwd=c(1,1),col=c("red","blue"))
```

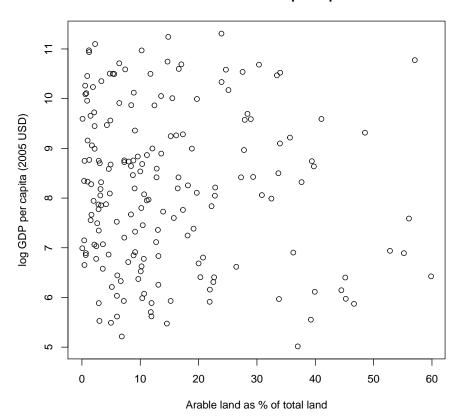

# Tutorial for legend: http://www.r-bloggers.com/adding-a-legend-to-a-plot/

#### c.

(1/4 point) Draw the scatterplot of that variable against another variable.

### Arable land and GDP per capita

### d.

(1/4 point) Label the point that represents your country (Hint: Tutorial) and color it red (Some Googling involved)

### Arable land and GDP per capita
